Motivation

Problem:

Asymmetric schemes like RSA and Elgamal require exponentiations in integer rings and fields with parameters of more than 1000 bits.

- High computational effort on CPUs with 32-bit or 64-bit arithmetic
- Large parameter sizes critical for storage on small and embedded

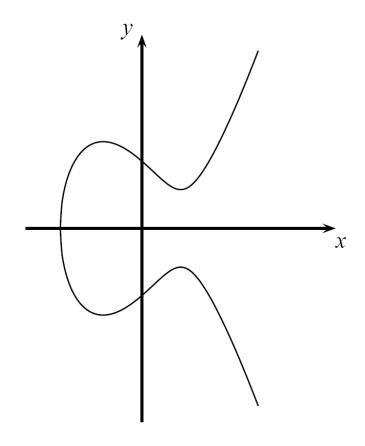

Motivation:

Smaller field sizes providing equivalent security are desirable

Solution:

Elliptic Curve Cryptography uses a group of points (instead of integers) for cryptographic schemes with coefficient sizes of 160-256 bits, reducing significantly the computational effort.

Computations on Elliptic Curves

• Elliptic curves are polynomials that define points based on the (simplified) Weierstraß equation:

$$y^2 = x^3 + ax + b$$

for parameters a,b that specify the exact shape of the curve

- On the real numbers and with parameters
 a, b∈R, an elliptic curve looks like this →
- Elliptic curves can not just be defined over the real numbers R but over many other types of finite fields.

Example: $y^2 = x^3 - 3x + 3$ over *R*

In cryptography, we are interested in elliptic curves module a prime p:

Definition: Elliptic Curves over prime fields

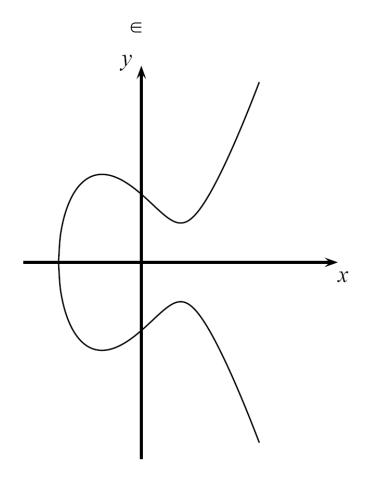

The elliptic curve over Z_p , p>3 is the set of all pairs $(x,y) \in Z_p$ which fulfill

$$y^2 = x^3 + ax + b \mod p$$

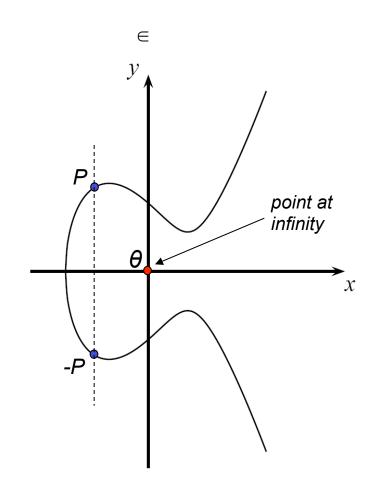

together with an imaginary point of infinity θ , where $a,b\in Z_p$ and the condition

$$4a^3+27b^2 \neq 0 \mod p$$
.

• Note that $Z_p = \{0, 1, ..., p - 1\}$ is a set of integers with modulo p arithmetic

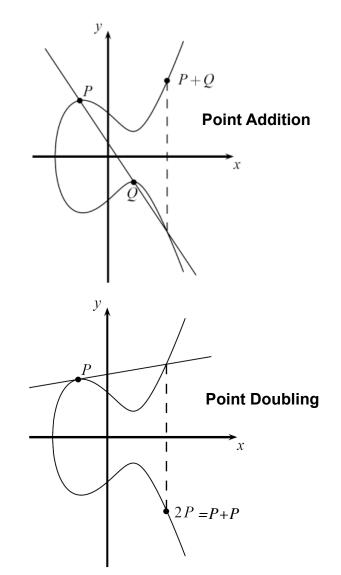

- Some special considerations are required to convert elliptic curves into a group of points
 - In any group, a special element is required to allow for the identity operation, i.e., given P∈E: P + θ = P = θ + P
 - This identity point (which is not on the curve) is additionally added to the group definition
 - This (infinite) identity point is denoted by θ
- Elliptic Curve are symmetric along the x-axis
 - Up to two solutions y and -y exist for each quadratic residue x of the elliptic curve
 - For each point P = (x,y), the inverse or negative point is defined as -P = (x,-y)

 \in

- Generating a group of points on elliptic curves based on point addition operation P+Q=R, i.e., $(x_P,y_P)+(x_Q,y_Q)=(x_R,y_R)$
- Geometric Interpretation of point addition operation
 - Draw straight line through P and Q; if P=Q use tangent line instead
 - Mirror third intersection point of drawn line with the elliptic curve along the x-axis
- Elliptic Curve Point Addition and Doubling Formulas

$$x_3 = s^2 - x_1 - x_2 \mod p \text{ and } y_3 = s(x_1 - x_3) - y_1 \mod p$$
where
$$s = \begin{cases} \frac{y_2 - y_1}{x_2 - x_1} \mod p & \text{; if P } \neq Q \text{ (point addition)} \\ \frac{3x_1^2 + a}{2y_1} \mod p & \text{; if P } = Q \text{ (point doubling)} \end{cases}$$

Example: Given *E*: $y^2 = x^3 + 2x + 2 \mod 17$ and point P = (5, 1)

Goal: Compute $2P = P + P = (5,1) + (5,1) = (x_3, y_3)$

$$s = \frac{3x_1^2 + a}{2y_1} = (2 \cdot 1)^{-1}(3 \cdot 5^2 + 2) = 2^{-1} \cdot 9 \equiv 9 \cdot 9 \equiv 13 \mod 17$$

$$x_3 = s^2 - x_1 - x_2 = 13^2 - 5 - 5 = 159 \equiv 6 \mod 17$$

 $y_3 = s(x_1 - x_3) - y_1 = 13(5 - 6) - 1 = -14 \equiv 3 \mod 17$

Finally
$$2P = (5,1) + (5,1) = (6,3)$$

• The points on an elliptic curve and the point at infinity θ form cyclic subgroups

$$2P = (5,1)+(5,1) = (6,3)$$
 $3P = 2P+P = (10,6)$
 $4P = (3,1)$
 $5P = (9,16)$
 $6P = (16,13)$
 $7P = (0,6)$
 $8P = (13,7)$
 $9P = (7,6)$
 $11P = (13,10)$
 $12P = (0,11)$
 $13P = (16,4)$
 $14P = (9,1)$
 $15P = (3,16)$
 $16P = (10,11)$
 $17P = (6,14)$
 $19P = \theta$

This elliptic curve has order #E = |E| = 19 since it contains 19 points in its cyclic group.

Number of Points on an Elliptic Curve

- How many points can be on an arbitrary elliptic curve?
 - Consider previous example: $E: y^2 = x^3 + 2x + 2 \mod 17$ has 19 points
 - However, determining the point count on elliptic curves in general is hard
- But Hasse's theorem bounds the number of points to a restricted interval

Definition: Hasse's Theorem:

Given an elliptic curve module p, the number of points on the curve is denoted by #E and is bounded by

$$p+1-2\sqrt{p} \le \#E \le p+1+2\sqrt{p}$$

- Interpretation: The number of points is "close to" the prime p
- **Example:** To generate a curve with about 2¹⁶⁰ points, a prime with a length of about 160 bits is required

Elliptic Curve Discrete Logarithm Problem

 Cryptosystems rely on the hardness of the Elliptic Curve Discrete Logarithm Problem (ECDLP)

Definition: Elliptic Curve Discrete Logarithm Problem (ECDLP)

Given a primitive element P and another element T on an elliptic curve E. The ECDL problem is finding the integer d, where $1 \le d \le \#E$ such that

$$P + P + ... + P = dP = T.$$

- Cryptosystems are based on the idea that d is large and kept secret and attackers cannot compute it easily
- If d is known, an efficient method to compute the point multiplication dP is required to create a reasonable cryptosystem
 - Known Square-and-Multiply Method can be adapted to Elliptic Curves
 - The method for efficient point multiplication on elliptic curves: Double-and-Add Algorithm

Double-and-Add Algorithm for Point Multiplication

Double-and-Add Algorithm

Input: Elliptic curve E_i , an elliptic curve point P and a scalar d with bits d_i

Output: T = dP

Initialization:

$$T = P$$

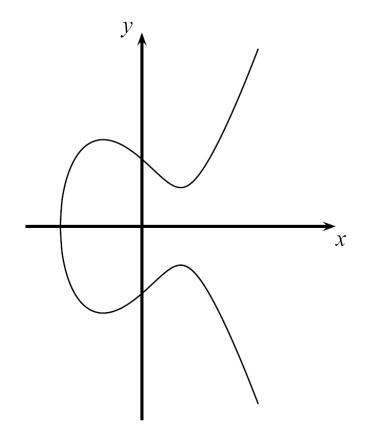

Algorithm:

FOR
$$i = t - 1$$
 DOWNTO 0
$$T = T + T \mod n$$
IF $d_i = 1$

$$T = T + P \mod n$$
RETURN (T)

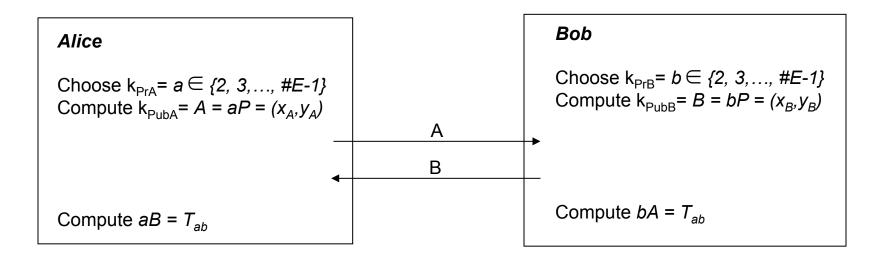

```
Example: 26P = (11010_2)P = (d_4d_3d_2d_1d_0)_2 P.
Step
#0
               P = 1_{2}P
                                                            inital setting
               P+P = 2P = 10_{2}P
#1a
                                                            DOUBLE (bit d<sub>3</sub>)
               2P+P = 3P = 10^2 P+1_2P = 11_2P
#1b
                                                            ADD (bit d_3=1)
#2a
               3P+3P = 6P = 2(11_2P) = 110_2P
                                                            DOUBLE (bit d<sub>2</sub>)
#2b
                                                            no ADD (d_2 = 0)
               6P+6P = 12P = 2(110_{2}P) = 1100_{2}P
                                                            DOUBLE (bit d<sub>1</sub>)
#3a
               12P+P = 13P = 1100_{2}P+1_{2}P = 1101_{2}P ADD (bit d<sub>1</sub>=1)
#3b
               13P+13P = 26P = 2(\bar{1}101_{2}P) = 1101\bar{0}_{2}P DOUBLE (bit d<sub>0</sub>)
#4a
                                                            no ADD (d_0 = 0)
#4b
```

The Elliptic Curve Diffie-Hellman Key Exchange (ECDH)

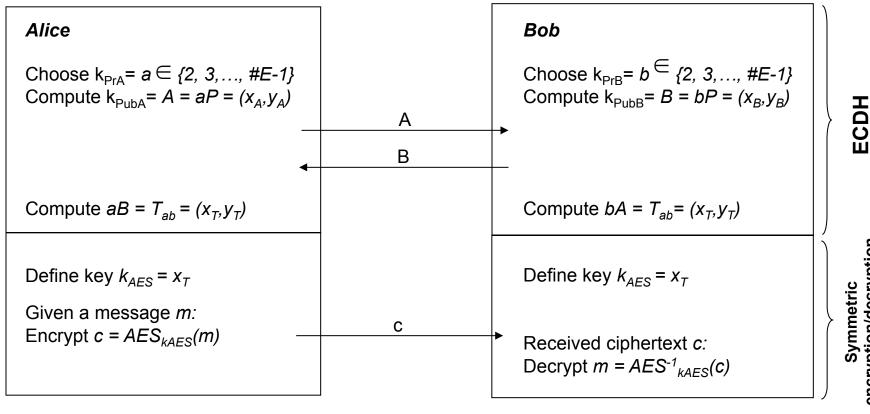

- Given a prime p, a suitable elliptic curve E and a point $P=(x_P, y_P)$
- The Elliptic Curve Diffie-Hellman Key Exchange is defined by the following protocol:

- Joint secret between Alice and Bob: T_{AB} = (x_{AB}, y_{AB})
- Proof for correctness:
 - Alice computes aB=a(bP)=abP
 - Bob computes bA=b(aP)=abP since group is associative
- One of the coordinates of the point T_{AB} (usually the x-coordinate) can be used as session key (often after applying a hash function)

The Elliptic Curve Diffie-Hellman Key Exchange (ECDH) (ctd.)

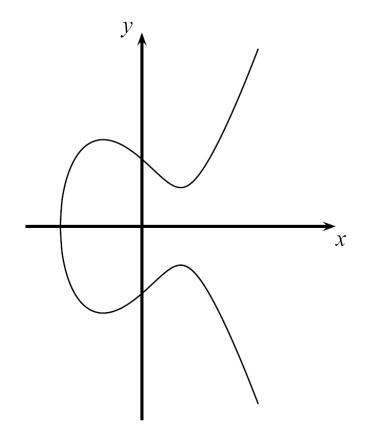

- The ECDH is often used to derive session keys for (symmetric) encryption
- One of the coordinates of the point T_{AB} (usually the x-coordinate) is taken as session key

encryption/decryption

In some cases, a hash function (see next chapters) is used to derive the session key

- The Elliptic Curve Diffie-Hellman Protocol
- Security Aspects
- Implementation in Software and Hardware

Security Aspects

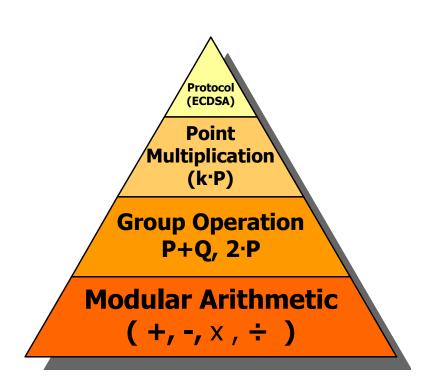

- Why are parameters signficantly smaller for elliptic curves (160-256 bit) than for RSA (1024-3076 bit)?
 - Attacks on groups of elliptic curves are weaker than available factoring algorithms or integer DL attacks
 - Best known attacks on elliptic curves (chosen according to cryptographic criterions)
 are the Baby-Step Giant-Step and Pollard-Rho method
 - Complexity of these methods: on average, roughly \sqrt{p} steps are required before the ECDLP can be successfully solved
- Implications to practical parameter sizes for elliptic curves:
 - An elliptic curve using a prime p with 160 bit (and roughly 2¹⁶⁰ points) provides a security of 2⁸⁰ steps that required by an attacker (on average)
 - An elliptic curve using a prime p with 256 bit (roughly 2²⁵⁶ points) provides a security of 2¹²⁸ steps on average

- Introduction
- Computations on Elliptic Curves
- The Elliptic Curve Diffie-Hellman Protocol
- Security Aspects
- Implementation in Software and Hardware

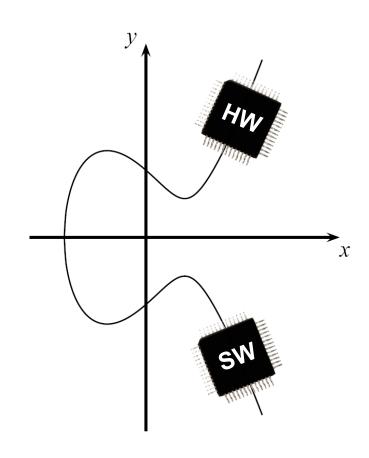

Implementations in Hardware and Software

- Elliptic curve computations usually regarded as consisting of four layers:
 - Basic modular arithmetic operations are computationally most expensive
 - Group operation implements point doubling and point addition
 - Point multiplication can be implemented using the Double-and-Add method
 - Upper layer protocols like ECDH and ECDSA
- Most efforts should go in optimizations of the modular arithmetic operations, such as
 - Modular addition and subtraction
 - Modular multiplication
 - Modular inversion

Implementations in Hardware and Software

- Software implementations
 - Optimized 256-bit ECC implementation on 3GHz 64-bit CPU requires about 2 ms per point multiplication
 - Less powerful microprocessors (e.g, on SmartCards or cell phones) even take significantly longer (>10 ms)
- Hardware implementations
 - High-performance implementations with 256-bit special primes can compute a point multiplication in a few hundred microseconds on reconfigurable hardware
 - Dedicated chips for ECC can compute a point multiplication even in a few ten microseconds

Lessons Learned

- Elliptic Curve Cryptography (ECC) is based on the discrete logarithm problem.
 It requires, for instance, arithmetic modulo a prime.
- ECC can be used for key exchange, for digital signatures and for encryption.
- ECC provides the same level of security as RSA or discrete logarithm systems over Z_p with considerably shorter operands (approximately 160–256 bit vs. 1024–3072 bit), which results in shorter ciphertexts and signatures.
- In many cases ECC has performance advantages over other public-key algorithms.
- ECC is slowly gaining popularity in applications, compared to other public-key schemes, i.e., many new applications, especially on embedded platforms, make use of elliptic curve cryptography.
